

BABY MONITORING SYSTEM

Fab Academy 2020 | Mr. Neeraj Gupta

Baby monitoring system (BMS) is a product which is made to relieve the parents of the new born baby. The parents can monitor the condition of the child from the far location or from their offices as well. The Baby Monitoring system is designed with a temperature sensor and a cry detection mechanism which actuates the fan and a lullaby toy installed in the cradle to rotate if the baby starts to cry or if the temperature of the room reaches to a certain level. The data of the temperature and humidity can be accessed through a web browser and a camera is also installed in the cradle which also facilitates the live feed of the baby.
